

Dear FCC,

I feel that it is very important for Satellite radio to be allowed to broadcast local traffic and weather conditions. I personally get most of my traffic and weather information from the internet rather than local radio stations. Therefore if satellite radio carries this information, it will not result in a decreased amount of listening to the local radio stations for me.

The reason I purchased satellite radio was that I was so fed up with the amount of annoying commercials and lack of quality programming on the current radio stations. Perhaps if the local stations spent more time and money on refining their programming, I would be more interested in listening to it. There is no reason that the NAB should be able to prevent satellite radio from carrying this type of local content.

Thanks for your time,  
Pieter
